Sales Performance Dashboard

Project problem statement, data terminology, KPI definitions and analytical scope

1. Problem statement

A sales operations team needs a consistent view of order revenue, unit sales, product mix and performance across regions and channels. Reviewing individual transactions makes it difficult to identify strong categories, seasonal changes or customer segments. This Excel project brings order-level records into a dashboard and pivot summaries to support sales performance monitoring and descriptive business analysis.

2. Project objectives

- Monitor revenue, unique orders, units sold and average revenue per order.
- Compare sales by month, region, product category and sales channel.
- Assess sales contribution by customer type, product and salesperson.
- Create repeatable Excel summaries to support management reporting.

3. Workbook inventory and scope

The workbook has three sheets: Dashboard, Pivot_Table and Sales_Data. Sales_Data contains 2,000 order-level rows and 12 fields, dated 01 January 2026 to 31 December 2026. Pivot_Table contains summary calculations and breakdowns. The Dashboard sheet includes dashboard objects that are not represented by ordinary worksheet cell values. The dataset provenance, monetary currency and extraction method are not documented.

4. Headline measures

Total revenue: 3,462,605.32 (currency unspecified).

Unique orders: 2,000.

Units sold: 7,552.

Average revenue per order: 1,731.30.

- Revenue is an order-level reported measure; it is not profit.
- Figures were calculated from the Sales_Data records and should be interpreted as descriptive summaries.

5. Data dictionary and terminology

Field	Meaning / interpretation
Order ID	Unique identifier for a sales order; use distinct counts when reporting orders.
Date	Recorded order date, used for month-based trends.
Region	Geographic sales territory or business region.
Sales Channel	Route through which an order was sold (e.g., Online or Retail Store).

Customer Type	Customer segment classification (New or Returning).
Product Category	Broad classification of the product sold.
Product	Specific item purchased.
Salesperson	Sales representative associated with the order.
Quantity	Number of units included in the order.
Unit Price	Listed price per unit in unspecified currency.
Discount	Recorded discount fraction; e.g., 0.05 represents 5%.
Revenue	Recorded order revenue after applicable discount, subject to rounding.

6. KPI definitions

- Total revenue = SUM(Revenue).
- Total orders = DISTINCTCOUNT(Order ID).
- Units sold = SUM(Quantity).
- Average revenue per order = Total revenue / distinct orders.
- Revenue by region, channel, category or month = SUM(Revenue) grouped by the selected dimension.
- Revenue share = segment revenue / total revenue × 100.
- Discount rate = recorded Discount fraction; a simple average is not revenue-weighted.

7. Suggested analysis questions

- Which months generate the highest and lowest revenue?
- Which regions, product categories and channels contribute most to revenue?
- How do new and returning customers differ in revenue contribution?
- Which products and salespeople generate the highest recorded revenue?
- Do discount patterns differ by product category or sales channel?

8. Data quality, assumptions and limitations

- Confirm whether each Order ID corresponds to one order or one order line; the dataset has one row per observed Order ID.
- Confirm monetary currency, origin and licensing before publishing the workbook.
- Check for missing fields, unusual discounts, negative quantities and date inconsistencies.
- Revenue does not account for costs, refunds, taxes or profit unless separately documented.
- Data spans 2026, including dates later than the current publication date; treat this as a practice or synthetic dataset unless provenance confirms otherwise.
- Dashboard visual objects and slicers should be validated in desktop Excel.

9. Tools and deliverables

Microsoft Excel: source table, pivot-based summaries and dashboard reporting. GitHub portfolio deliverables: workbook (if redistribution is permitted), project documentation and README.md.

10. Portfolio description

Built an Excel sales performance dashboard using 2,000 sales records to analyze 3,462,605.32 in reported revenue across products, regions and sales channels. Organized order-level data into pivot summaries and dashboard views for tracking sales volume, customer segments and product performance.
